

Small Retail Store, Single Zone

In this example we have a suggested layout for a small retail store. Ceiling speakers have been used for simplicity and they are all in one area or 'zone'. Volume levels can be attenuated in changing rooms etc by use of the tapings on the loudspeaker transformers. A paging mic enables voice calls without shouting across the shop and an MP3 player provides background music.

Small Retail Store, Pseudo Two Zone

In this example, two loudspeaker zones are created for the retail space and warehouse / stockroom area. A two button paging mic enables voice calls to each of the 'zones' independently and an MP3 player provides background music into both areas. Discreet ceiling speakers are used in the shop floor area and wall mounted cabinet speakers are used in the warehouse.

Retail Store, Four Zones

In this example, we are looking at a store over 2 floors, with a Café and warehouse thereby requiring four loudspeaker zones with background music and paging capability. A paging microphone is situated in each of the public areas. A CD player and MP3 player provide background music and a digital message player enables promotional messages and customer information announcements to be made automatically via an inbuilt scheduler.

Each of the four zones also has a locally situated volume control. Discreet ceiling speakers are used in the shop floor areas with compact wall mounted cabinet speakers in the Café and larger more powerful cabinets in the warehouse / stockroom.
