

Manufacturing Facility, Small Scale

This is a simple background music and paging system which can be adapted to suit many small to medium sized businesses with offices and warehouse space.

A 2 button paging mic enables the offices and warehouse space to be paged independently and an MP3 player or tuner could be used for background music.

The cabinet speakers in the warehouse could be changed for pendant speakers if there is a high ceiling for more even coverage. Discreet ceiling speakers are used in the office area.

Manufacturing - Large Scale

In this large scale manufacturing plant an eight channel mixer has been used along with 3 multi-channel power amplifiers.

Horn speakers have been used in the areas with high ambient noise to ensure any microphone paging or recorded messages are heard clearly. If background music is also needed in these areas music horns could be used instead. The message player can be used to make scheduled announcements at shift change or meal break times for example.

Ceiling speakers are used in the offices and canteen for background music and paging with small cabinet speakers wall mounted in the engineering department. Pendant speakers have been suggested for the packing and despatch area for widespread coverage from an assumed high ceiling.
